## Abstracts

The global Animal Model Platform market size is predicted to grow from US\$ 3775 million in 2025 to US\$ 6193 million in 2032; it is expected to grow at a CAGR of 7.5% from 2026 to 2032.

Animal Model Platform refers to a comprehensive service system that provides standardized or customized animal models, as well as supporting technical services (such as breeding, phenotypic analysis, and pharmacodynamic evaluation) for biomedical research, drug development, and toxicology testing. The core animal models include genetically engineered models (e.g., CRISPR-edited mice, knockout rats), immunodeficient models (e.g., nude mice, NOD-scid mice), and humanized models (e.g., humanized immune system mice). These platforms leverage advanced technologies (such as gene editing, embryo manipulation, and in vivo imaging) to simulate human diseases (e.g., tumors, Alzheimer's disease, diabetes), enabling researchers to verify drug efficacy, study disease mechanisms, and assess safety.

The animal model platform market is growing steadily as pharmaceutical and biotechnology companies accelerate R&D for new drugs and advanced therapies. Demand for transgenic, humanized, and disease-specific animal models is increasing, driven by personalized medicine and immunotherapy research. Integration of CRISPR/Cas9 gene editing technology has enhanced precision and efficiency in model creation. Additionally, regulatory emphasis on data reproducibility and ethical standards is reshaping platform operations, promoting refined animal welfare practices and alternative model validation methods. Asia-Pacific is emerging as a high-growth region due to the rapid expansion of preclinical research capabilities and the localization of global CROs.
