The global Animal Serum Product market size is predicted to grow from US\$ 1512 million in 2025 to US\$ 1945 million in 2032; it is expected to grow at a CAGR of 3.7% from 2026 to 2032.

Serum is the component that is neither a blood cell (serum does not contain white or red blood cells) nor a clotting factor; it is the blood plasma not including the fibrinogens. Serum includes all proteins not used in blood clotting (coagulation) and all the electrolytes, antibodies, antigens, hormones, and any exogenous substances (e.g., drugs and microorganisms).

The animal serum product market is primarily driven by its extensive use in various applications, including cell culture, biopharmaceutical production, and diagnostics. Fetal bovine serum (FBS) and other animal-derived sera contain essential nutrients and growth factors necessary for cell growth and viability, making them indispensable in research and industrial processes. Moreover, the increasing demand for biologics and personalized medicine fuels the need for high-quality animal serum products to support cell-based therapies and recombinant protein production. However, the market also faces challenges, notably concerns about ethical considerations and the risk of contaminations associated with animal-derived products. There is a growing push towards animal-free and defined media alternatives to address these challenges. Additionally, the variability in serum composition from different sources and batches poses a challenge in ensuring consistent and reproducible results in cell-based research and biomanufacturing.
