The global Animal Vaccine Adjuvant market size is projected to grow from US\$ 322.8 million in 2022 to US\$ 492.6 million in 2029; it is expected to grow at a CAGR of 6.2% from 2023 to 2029.

Globally, dog and cat ownership is gaining popularity, especially after the pandemic. Such an increase in the rate of pet ownership across the world is expected to boost the market's growth. The increasing animal health expenditure by owners to ensure better diagnosis and treatment and increasing pet ownership are expected to positively impact the veterinary vaccine adjuvants market.

An adjuvant is a substance that is formulated as part of a vaccine to enhance its ability to induce protection against infection. Adjuvants are substances added to vaccines to enhance the immunogenicity of highly purified antigens that have insufficient immunostimulatory capabilities. And many vaccines also contain an adjuvant or adjuvant combination: these are substances added to vaccines specifically because of their immune enhancing effects. Adjuvants were initially used to counter the poor immunogenic potential of highly purified antigens. In recent years their role has expanded as our understanding of the immunology of vaccination has grown.
