Wound care requires a thorough assessment of the patient, not just the wound. The first step in animal wound care is the assessment of the overall stability of the animal. After the initial assessment, first aid needs to be given immediately. Sometimes, these wounds can be traumatic, which may require surgical procedures. A wound must be protected from contamination or trauma by covering it with a sterile, lint-free dressing. There should not be much delay between examination and definitive debridement to decrease bacterial contamination. Antibiotic therapy should be given in cases of infected, dirty, or punctured wounds
