Abstracts

The global Anisotropic Ferrite Magnet market size is predicted to grow from US$ 3950 million in 2025 to US$ 5404 million in 2032; it is expected to grow at a CAGR of 4.7% from 2026 to 2032.

An anisotropic ferrite magnet is a hard ferrite (strontium or barium ferrite) magnetic material that is pressed and sintered under an applied magnetic field so its crystal grains align in one preferred orientation, giving it significantly higher magnetic strength (Br, Hc, BHmax) than isotropic ferrite. Its supply chain begins with raw materials such as Fe?O?, BaCO?/SrCO?, additives, and fluxes; followed by calcination to form ferrite powder, wet milling to controlled particle size, and magnetic-field pressing (uniaxial or die press) to induce anisotropy. The pressed bodies then go through sintering, machining (if needed), surface coating (epoxy, nickel, phosphate), and magnetizing with a high-energy pulse. Downstream, these magnets move to component integrators and OEMs for motors, speakers, sensors, automotive components, appliance motors, and industrial machinery producers, creating a vertically connected chain from chemical suppliers ? ferrite powder producers ? sintered magnet manufacturers ? motor/speaker OEMs ? end-use industries. In 2024, global anisotropic ferrite magnet output reached 2.25 million tons with capacity at 2.65 million tons, priced at USD 1,450–2,850 per ton and delivering an average 23% gross margin.

United States market for Anisotropic Ferrite Magnet is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
