Abstracts

The global Anti-block Masterbatch market size is predicted to grow from US$ 99 million in 2025 to US$ 146 million in 2031; it is expected to grow at a CAGR of 6.7% from 2025 to 2031.

Antiblock Materbatches are added to films and bags to keep the sheets from sticking together. They are used to lessen the adhesion of the surface of products made from the formulation of like or different surfaces.

In all kinds of plastic films for flexible packaging and industrial applications, antiblocking properties are very important for further handling, converting and retail. Plastic layers tend to stick together. The addition of an antiblocking agent creates space between 2 plastic layers (surface roughness) preventing so-called blocking. Mostly antiblocking agents are used in multilayer structure films in order to have the highest benefit. Some antiblocking particles are acting as non-migrating slipping agent. The selection of an antiblocking masterbatch type is depending of the required film properties, applications and polymer used.
