The global Anti-Fraud Solutions for Financial market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Financial fraud is a special behavior that occurs in the financial field. Specifically, it refers to the internal personnel, customers or third parties of financial institutions, alone or in collaboration with others, defrauding illegitimate benefits or interests by fabricating facts or concealing the truth, resulting in financial institution funds, Acts of reputation or other damage.

In order to better deal with fraud risks, in recent years, financial institutions have begun to vigorously study risk control methods, strengthen the division of labor and cooperation between different product lines and business departments, and prevent fraud risks. Overall, fraud risk management is still in the early stages, and security and anti-fraud work must keep pace with the times and closely follow the needs of financial business risk control.

In recent years, with the changes in the internal and external environment of the financial industry, a series of changes have also occurred in related fraudulent activities. Fraud and anti-fraud in the financial industry have been competing and evolving with each other. While technologies such as big data analysis and deep learning are used by financial institutions to build anti-fraud capabilities, they are also used by black and gray industries to upgrade fraudulent behavior. Financial fraud methods have gradually evolved from traditional methods such as stealing user accounts and swiping bank cards to current highly specialized behaviors, showing the characteristics of industrialization, gangs, concealment, and extremes, and have great impact on the anti-

fraud of financial institutions. Capabilities present even greater challenges.

As the attack methods of black and gray products become more refined and customized, the protection effect of the traditional unified system becomes more and more limited. How to quickly respond to new attacks and realize the security protection of "thousands of people and thousands of faces" has become a common discussion and thinking in the current industry. direction. The application of various technologies such as small sample learning, graph computing and knowledge graphs, AI confrontation, privacy protection computing, and threat intelligence has become the focus of attention in the market. For financial institutions, it is necessary to fully combine and supplement existing anti-fraud methods such as corresponding technologies with traditional expert experience, rule models, and fraud lists in order to form better anti-fraud measures based on their own risk exposures. fraudulent effect.
