The report requires updating with new data and is sent in 48 hours after order is placed.

Radiation-proof glass is mainly glass that has a large absorption function for X and Y rays. When rays enter the protective glass, a photoelectric effect is generated inside the glass, generating positive and negative electron pairs, and simultaneously generating excited state and free state electrons, which reduces the energy of the incident x/? rays and reduces the penetration rate, thereby playing a role Protective effect. This report studies radiation-resistant glass for nuclear power.
