Anti-VEGF/VEGFR macromolecular drugs are advanced therapeutic agents designed to inhibit the vascular endothelial growth factor (VEGF) and its receptor (VEGFR) pathways. These drugs are used to treat various cancers and eye diseases by preventing the formation of new blood vessels that supply nutrients to tumors and diseased tissues. By targeting the VEGF/VEGFR interaction, these macromolecular drugs effectively reduce angiogenesis, thereby hindering disease progression and improving patient outcomes. They represent a significant advancement in targeted therapy, offering a promising approach to managing conditions that involve abnormal blood vessel growth.
