Anti-VEGF (Vascular Endothelial Growth Factor) drugs are a class of medications used to treat various eye conditions, particularly those affecting the retina and blood vessels at the back of the eye. VEGF is a protein that promotes the growth of new blood vessels. In certain eye diseases, excessive VEGF can contribute to abnormal blood vessel growth and leakage, causing vision problems or loss.

Anti-VEGF drugs work by inhibiting or blocking the activity of VEGF, thus helping to reduce the growth of abnormal blood vessels and fluid leakage within the eye. These drugs are administered directly into the eye using injections.
