Anti-wear additives prevent wear and loss of the metal surfaces during boundary film and mixed-film lubrication. It is triggered by elevated temperature or pressure at the contact surfaces and forms a protective layer to reduce the wear. The anti-wear additives chemically react with the metal contact surfaces to protect them from corrosive acids, wear, and oxidation of the base oil. These additives have a chemical composition based on phosphorous and zinc compounds, often zinc dialkyl dithiophosphate (ZDDP). These are commonly employed in gear oils, engine oils, hydraulic oils, automatic transmission fluids, and some greases.
