There are two types of antibacterial stainless steel: one is coated antibacterial stainless steel; the other is alloy type antibacterial stainless steel. Coated antibacterial stainless steel has many shortcomings such as easy wear and peeling during use of antibacterial coating, and it is difficult to maintain long-term antibacterial. Alloy type antibacterial stainless steel refers to the addition of metal copper Cu or silver Ag to the stainless steel material matrix, and after a special antibacterial heat treatment process, small and evenly distributed antibacterial metal particles are formed in the matrix, exposed on the surface of the stainless steel and exposed to the aqueous solution. Or in a humid environment, antibacterial metal ions are precipitated, which destroys the bacterial cell wall and has a bactericidal effect.
