## Abstracts

The global Antibacterial Suture market size is predicted to grow from US\$ 472 million in 2025 to US\$ 663 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

In 2025, global output of antibacterial sutures reached 1.15 billion units, with an average selling price of USD 0.42 per unit, production capacity of 1,380,000,000 units, and a gross margin of 55%.

Antibacterial sutures are medical consumables that incorporate antimicrobial technologies into conventional surgical sutures. This is typically achieved by coating the suture surface with antibacterial agents such as triclosan or silver ions, or by embedding antimicrobial mechanisms within the material system to inhibit bacterial adhesion and proliferation at the wound site. While maintaining essential tensile strength and biocompatibility, antibacterial sutures help reduce the risk of surgical site infections and are widely used in general surgery, orthopedics, cardiothoracic surgery, and procedures with elevated infection risk.

The antibacterial suture market continues to grow steadily, driven by increasing global surgical volumes, stricter hospital requirements for surgical site infection control, and rising clinical acceptance of antimicrobial suture materials. Compared with conventional sutures, antibacterial sutures offer clear clinical value and pricing premiums, with growing penetration in high-risk surgeries and higher-tier healthcare institutions. Structurally, multinational medical device companies dominate the high-end antibacterial suture segment, while emerging markets are driven by cost-effective products and local substitution. Competition focuses on durability of antimicrobial efficacy, biocompatibility, cost efficiency, and compatibility with established surgical workflows.
