The global Antibiotic Resistant Infection market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

An antibiotic-resistant infection refers to a bacterial or fungal infection that does not respond to standard antibiotic or antifungal treatments that would typically be effective against the causative microorganism. This resistance occurs when bacteria or fungi develop mechanisms to evade the effects of antibiotics or antifungals, often due to genetic mutations or acquiring resistance genes from other organisms. Antibiotic-resistant infections pose significant challenges in healthcare settings, as they can lead to prolonged illness, increased mortality rates, and higher healthcare costs. Managing these infections requires alternative treatment strategies, such as using different classes of antibiotics, combination therapies, or non-antibiotic approaches, and emphasizes the importance of infection control measures to prevent their spread.
