## Abstracts

According to this study, the global Antibody Fusion Protein Drugs market size will reach US\$ 79749 million by 2031.

Antibody fusion protein drugs are biopharmaceuticals created by genetically fusing the functional domain of an antibody (usually the Fc region) with another biologically active protein or peptide, such as a receptor, ligand, or enzyme. This fusion enhances the drug's stability, half-life, and targeting ability. These drugs are commonly used in the treatment of autoimmune diseases, cancers, and inflammatory disorders. A well-known example is etanercept, which combines the TNF receptor with the Fc portion of human IgG1.

The antibody fusion protein market is driven by its potential to revolutionize targeted therapies and address unmet medical needs. These fusion proteins combine the specificity of antibodies with the therapeutic effects of other molecules, offering novel treatment options for various diseases, including cancer, autoimmune disorders, and infectious diseases. The ability to precisely target specific cells or molecules enhances efficacy while potentially reducing side effects. Moreover, advancements in biotechnology and genetic engineering have enabled the development of more potent and personalized antibody fusion proteins. However, the market faces challenges such as complex manufacturing processes, high development costs, and regulatory hurdles for approval. Overcoming these challenges and continued research in this field will be crucial for maximizing the therapeutic potential and driving the growth of the antibody fusion protein market.
