Abstracts

The global Antibody Masking Technology market size is predicted to grow from US$ 111 million in 2025 to US$ 496 million in 2032; it is expected to grow at a CAGR of 24.3% from 2026 to 2032.

Peptide or antibody?masking technologies are designed to keep an antibody inactive (masked) in circulation and allow it to bind its target only after it reaches a protease?rich disease site (usually the tumour microenvironment). This concept addresses on?target, off?tumour toxicity for therapeutic antibodies and forms the basis of several proprietary platforms such as CytomX's Probody, Adagene's SAFEbody , Janux's TRACTr/TRACIr, Vir/Amunix's PRO?XTEN , Zymeworks' ProTECT, Xilio's masked T?cell engagers, and others. These platforms are still in early commercialisation and no marketed product yet uses peptide masking; however, the increasing number of high?value licensing deals and the broader growth in biologics and antibody?drug conjugates (ADCs) provide insight into the commercial potential of this technology.

Peptide/antibody?masking technologies represent a promising next?generation platform for antibody therapeutics. Licensing deals show that pharmaceutical partners are willing to pay upfront fees in the tens of millions of dollars and offer milestone payments that can exceed half a billion dollars per program, with tiered royalties on commercial sale.

United States market for Antibody Masking Technology is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
