Anticoagulants, commonly referred to as blood thinners, are chemical substances that prevent or reduce coagulation of blood, prolonging the clotting time. Some of them occur naturally in blood-eating animals such as leeches and mosquitoes, where they help keep the bite area unclotted long enough for the animal to obtain some blood. As a class of medications, anticoagulants are used in therapy for thrombotic disorders. Oral anticoagulants (OACs) are taken by many people in pill or tablet form, and various intravenous anticoagulant dosage forms are used in hospitals. Some anticoagulants are used in medical equipment, such as test tubes, blood transfusion bags, and dialysis equipment.

Novel Oral Anticoagulants (NOACs) have major pharmacologic benefits over warfarin, which is a vitamin K antagonist, together with the rapid onset/offset of action, few drug interactions and predictable pharmacokinetics. Warfarin has a limited therapeutic window that can be strike by factors such as diet and enabling patients on warfarin to monitor their INR regularly. Novel oral anticoagulant (NOACs) is the top performing segment as an alternative to anticoagulant. Increasing number of patients with lifelong medical aid therapy, growing prevalence of blood vessel thromboembolism, arrhythmia, and stroke, acceptance of NOAC's is raising revenue in the market, rising outpatient anticoagulation therapy, increasing number of pipeline products under clinical trials and rising heparin trade spurring the growth of anticoagulation therapy market. However, high cost of developing drugs and risk of malfunctions like increased bleeding is main issue with newer agents are expected to impact the target market negatively.
