Antiemetics for dogs are veterinary medications used to prevent or alleviate vomiting in canines across various clinical settings, including motion sickness, gastroenteritis, dietary indiscretion, toxin ingestion, systemic infections, and chemotherapy-induced nausea. These drugs operate through different pharmacologic pathways and include neurokinin-1 (NK1) receptor antagonists (e.g., maropitant), dopamine D2 receptor antagonists (e.g., metoclopramide), serotonin 5-HT3 receptor antagonists (e.g., ondansetron), and antihistamines (e.g., diphenhydramine or promethazine). Drug selection depends on the underlying cause of vomiting, severity of symptoms, and patient-specific factors. Among them, maropitant has emerged as a first-line antiemetic in small animal medicine due to its targeted action, broad efficacy, and good tolerability. Both oral and injectable formulations are available, allowing flexible administration based on clinical need.
