Antifibrotic drugs are medications specifically designed to inhibit or slow down the process of fibrosis. The two main antifibrotic agents used for IPF are pirfenidone and nintedanib. Pirfenidone works by inhibiting processes involved in fibrosis, including reducing the production of pro-inflammatory cytokines and inhibiting fibroblast proliferation and collagen synthesis. Nintedanib, on the other hand, targets multiple tyrosine kinases that are implicated in pathways leading to fibrosis, thereby interfering with the progression of lung scarring.
