Anti-lock braking system (ABS) is an automotive safety system, allowing the wheels to maintain tractive contact with the road surface according to driver inputs while braking, preventing the wheels from locking up (ceasing rotation) and avoiding uncontrolled skidding. In general, anti-lock braking system (ABS) can benefit in two ways: stop faster and be able to steer while you stop.

There are four main components to an ABS system: speed sensors, pump, valves and controller. Speed sensors, located at each wheel, can provide the information that when a wheel is about to lock up. The valve is in the brake line of each brake controlled by the ABS. When a valve reduces the pressure in a line, the pump is there to get the pressure

back up. The controller is a computer in the car, watching the speed sensors and controlling the valves.
