Antimicrobial incise drapes are sterile adhesive surgical drapes coated with antimicrobial agents designed to prevent infection during surgery. These drapes are applied to the patient's skin around the surgical site before the incision is made. The antimicrobial coating helps reduce the growth and spread of bacteria, minimizing the risk of postoperative infections. Typically made from transparent, thin materials, these drapes allow the surgical team to clearly see the operative field while maintaining a sterile environment. Common antimicrobial agents used in these drapes include iodine-based compounds like povidone-iodine, or chlorhexidine. They are widely used in various types of surgeries.
