Antimicrobial Peptide Mimics are synthetic or semi-synthetic compounds designed to replicate the structure and function of naturally occurring antimicrobial peptides (AMPs), which are part of the innate immune defense in many organisms. Unlike traditional antibiotics, AMP mimics typically exert their effects by disrupting microbial membranes, making it harder for pathogens to develop resistance. These mimics are engineered for enhanced stability, reduced toxicity, and broader-spectrum activity against bacteria (including multidrug-resistant strains), fungi, and viruses. Common structural types include peptidomimetics, arylamide foldamers, α -peptides, and polymer-based mimics. They are increasingly explored in pharmaceutical, wound care, and coating applications due to their potential in overcoming antibiotic resistance.

United States market for Antimicrobial Peptide Mimics is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
