Antimony Trioxide Flame Retardant Masterbatch is a specialized polymeric compound formulated by incorporating antimony trioxide ( $Sb_2O_3$ ), a key flame-retardant additive, into a carrier resin matrix—typically polyethylene (PE), polypropylene (PP), or other thermoplastics—along with auxiliary agents like dispersants and stabilizers. This masterbatch serves as a concentrated additive system, designed to enhance the fire resistance of various plastic materials by interfering with the combustion process. When added to polymers during manufacturing, antimony trioxide works synergistically with halogen-based flame retardants (or alone in specific halogen-free systems) to suppress flame spread: it promotes the formation of a charred layer on the material's surface, which acts as a barrier to isolate heat and oxygen, while also capturing free radicals that sustain combustion. The masterbatch form ensures uniform dispersion of antimony trioxide in the base polymer, improving processing stability and minimizing dust exposure during handling, making it widely used in electronics, automotive components, construction materials, and textiles where flame retardancy is critical.
