The global Antioxidant DLTDP market size is predicted to grow from US$ 178 million in 2025 to US$ 234 million in 2032; it is expected to grow at a CAGR of 4.0% from 2026 to 2032.

The antioxidant DLTDP is a thioester auxiliary antioxidant, often used in conjunction with primary antioxidants (such as hindered phenols and hindered amines) to create a synergistic effect and extend the service life of polymer materials. It captures and decomposes peroxides produced during polymer degradation, inhibiting chain reactions and improving the material's heat resistance and aging resistance. Global production in 2024 was estimated to be approximately 22,000 tons, with an average selling price of $8,000 per ton.

The antioxidant DLTDP is primarily produced through a chemical synthesis reaction between thiodipropionic acid and lauryl alcohol. Thiodipropionic acid, the acidic component of DLTDP, and lauryl alcohol, the alcoholic component of DLTDP, react with thiodipropionic acid to form dilauryl ester. It is widely used in downstream applications such as plastics, rubber, and lubricants. In particular, it is often used in polyolefins (PE, PP), ABS, and PVC systems, often in combination with hindered phenolic antioxidants to form a highly efficient and stable system. This system ultimately finds its way into consumer markets, including packaging materials, automotive parts, wire and cable, appliance housings, and coatings.

United States market for Antioxidant DLTDP is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Antioxidant DLTDP is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
