Abstracts

The global Antiscalant market size is predicted to grow from US\$ 1571 million in 2025 to US\$ 2076 million in 2032; it is expected to grow at a CAGR of 4.2% from 2026 to 2032.

Antiscalant, in the context of reverse osmosis water treatment, refers to a specialty chemical added to RO feedwater to inhibit the formation and deposition of inorganic scale on membrane surfaces. It is mainly used to control calcium carbonate, calcium sulfate, barium sulfate, strontium sulfate, calcium fluoride, silica related scale and metal hydroxide deposits. By delaying precipitation, modifying crystal growth, dispersing fine particles and providing limited chelation, the product helps maintain membrane flux, reduce pressure rise, extend cleaning intervals and improve the long term stability of RO membrane systems.

The upstream raw materials of Antiscalant mainly include phosphonates, polyacrylic acid, acrylic acid copolymers, maleic acid based polymers, sulfonated copolymers, carboxylate polymers, dispersants, preservatives, solvents, water and pH regulators. Some formulations also use low phosphorus or phosphorus free polymer systems to meet stricter discharge and environmental requirements. Downstream applications are mainly found in seawater desalination, brackish water treatment, industrial pure water, electronics ultrapure water, power plant boiler make up water, municipal drinking water, wastewater reuse, landfill leachate treatment, food and beverage water systems, pharmaceutical water systems and other RO based separation processes.

In 2025, global sales of Antiscalant reached approximately 646 K tons, with an average global market price of around US\$ 2,487/ton. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 20% to 40%.

The Antiscalant market is closely linked to the expansion of RO membrane water

treatment. As desalination, industrial water reuse, municipal water purification and high purity process water continue to develop, RO systems are being used in a wider range of end markets. Scaling is one of the key factors affecting RO operating stability, because it can reduce membrane flux, increase operating pressure and shorten membrane service life. Therefore, Antiscalant has become a routine consumable chemical in RO operation rather than a simple auxiliary additive.

Market demand is mainly driven by water scarcity, tighter discharge requirements, higher industrial water recycling rates and the need for more stable operation under high recovery conditions. In power, electronics, chemical, pharmaceutical, food and beverage, landfill leachate and wastewater reuse projects, feedwater composition is often complex, and calcium, magnesium, sulfate, silica, iron, manganese and organic matter may jointly increase scaling risk. This creates stronger demand for application specific Antiscalants, water quality modeling and on site technical support.

From the supply side, the market is moving from general purpose products to more specialized and scenario based formulations. Conventional phosphonate and polycarboxylate products still have broad use because of mature technology and cost efficiency. However, high silica, high sulfate, high hardness, high metal ion and high recovery RO systems require more targeted solutions. Overall, the industry has resilient demand, while low end products face stronger price competition. Suppliers with formulation capability, membrane compatibility testing, field service experience and integrated membrane treatment solutions are more likely to build advantages in medium and high end applications.
