Antisense therapy is a form of treatment for genetic disorders or infections. When the genetic sequence of a particular gene is known to be causative of a particular disease, it is possible to synthesize a strand of nucleic acid (DNA, RNA or a chemical analogue) that will bind to the messenger RNA (mRNA) produced by that gene and inactivate it, effectively turning that gene 'off'.

North America is a key market, with U.S. reflecting a number of RNAi therapeutics currently in developmental pipelines. A number of biotechnology companies have made considerably high investments for RNAi therapeutic development. Big pharmaceutical

developers have entered into collaboration agreements or licensing deals with a number of smaller firms in an attempt to capitalize on the expected revenue growth of this market.
