The global Antistatic Agent B market size is predicted to grow from US\$ 209 million in 2025 to US\$ 300 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

In 2025, the global production of antistatic agent B was approximately 88,600 tons, with an average selling price of approximately US\$2,415 per ton. The single-line production capacity is approximately 4,500 tons per year, with an average gross profit margin of approximately 10-20%. Antistatic agent B is a condensate of alkylamine and ethylene oxide, belonging to the non-ionic surfactant category. Its main function is to eliminate or reduce the accumulation of static electricity on the surface of materials such as plastics and fibers. Its mechanism involves adsorbing water molecules from the air to form a conductive layer, allowing electrical charges to dissipate. It is mainly used in electronic equipment, packaging materials, textiles, and the automotive industry, effectively preventing electrostatic damage to products, improving operational safety, and enhancing the surface properties of materials.

The core upstream raw materials for antistatic agent B mainly include fatty amines and ethylene oxide, which are synthesized through ethoxylation reactions. Its downstream applications are directly in industries requiring static control, primarily including the packaging industry, electronics and electrical appliances, automotive interiors, and daily consumer goods, where it is added to plastic products to achieve long-lasting antistatic properties.

United States market for Antistatic Agent B is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Antistatic Agent B is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
