## Abstracts

The global API Vulnerability Scanner market size is predicted to grow from US\$ 2310 million in 2025 to US\$ 4128 million in 2032; it is expected to grow at a CAGR of 8.8% from 2026 to 2032.

An API vulnerability scanner is a tool that is used to identify and assess security vulnerabilities in APIs (Application Programming Interfaces). These scanners work by sending various types of requests to the API and analyzing the responses to detect potential security weaknesses such as injection attacks, broken authentication, insecure data transmission, and more. API vulnerability scanners can help organizations proactively identify and address security issues in their APIs before they are exploited by malicious actors. By regularly scanning APIs for vulnerabilities, organizations can ensure that their systems and data are secure and protected from potential cyber threats.

The API vulnerability scanner industry is undergoing rapid transformation, driven by the exponential growth of APIs and the escalating sophistication of cyber threats. In 2025, key trends include AI-driven threat detection and response, deep integration with DevSecOps workflows, adoption of zero-trust principles. First, AI and machine learning are reshaping both attack vectors and defense strategies. Malicious actors increasingly use AI to automate reconnaissance, craft evasive payloads, and exploit business logic flaws. In response, vendors are developing AI-enhanced scanners capable of real-time anomaly detection, behavioral pattern analysis, and predictive risk modeling. For example, AI-powered tools now identify zero-day vulnerabilities by analyzing API traffic patterns and historical data, reducing false positives while improving detection accuracy. These systems also automate incident response workflows, prioritizing critical vulnerabilities and generating actionable remediation reports. Second, DevSecOps

integration has become a cornerstone of modern API security. Organizations are shifting left, embedding vulnerability scanning into CI/CD pipelines to detect issues during development rather than post-deployment. Third, zero-trust architectures are gaining traction, with scanners now supporting workload identity management and mutual TLS (mTLS) to authenticate API calls across distributed cloud environments.
