Apparel eco-friendly fabric refers to textile materials used in clothing that are produced from sustainable, renewable, recycled, or biodegradable raw materials and manufactured through environmentally responsible processes that minimize water consumption, chemical usage, carbon emissions, and waste generation across the full lifecycle of the fabric.

The apparel eco-friendly fabric industry chain begins upstream with sustainable raw material suppliers providing organic cotton, hemp, bamboo, recycled polyester chips, and bio-based polymers, followed by midstream processes including fiber production, spinning, knitting or weaving, eco-friendly dyeing, and finishing using low-impact chemicals and water-saving technologies, and extends downstream to garment manufacturers, fashion brands, retailers, and e-commerce platforms that integrate sustainable fabrics into clothing products, distribute them globally, and promote circular economy models such as recycling, reuse, and low-carbon consumption driven by regulatory policies and environmentally conscious consumers.

Globally, numerous projects are under construction and planned focusing on scaling recycled polyester plants, bio-based fiber production facilities, and closed-loop textile recycling systems, including investments in large-scale chemical recycling plants in Europe and Asia, expansion of lyocell fiber capacity by major producers, development of biodegradable synthetic fiber factories, integration of AI-driven sustainable textile manufacturing lines, and establishment of circular textile hubs that combine recycling,

fiber regeneration, and fabric production, supported by government incentives and brand commitments to carbon neutrality and zero-waste goals across the apparel supply chain.
