The global Application Security Testing Service market size is predicted to grow from US$ 3440 million in 2025 to US$ 5991 million in 2032; it is expected to grow at a CAGR of 8.5% from 2026 to 2032.

Application Security Testing Service (ASPS) is a professional cybersecurity service provider that uses automated tools, manual analysis, and simulated attacks to conduct security assessments of application source code, binaries, runtime environments, web front-ends, mobile applications, APIs, third-party components, and business logic. Its main tasks include Static Application Security Testing (SAST), Dynamic Application Security Testing (DAST), Interactive Testing (IAST), Software Composition Analysis (SCA), API security testing, mobile application testing, manual penetration testing, and vulnerability retesting. ASPS also provides clients with vulnerability classification, attack path analysis, remediation recommendations, and compliance reports.

The market is shifting from one-off pre-launch penetration testing to continuous security testing embedded in CI/CD processes. Enterprises are increasingly adopting DevSecOps, managed application security testing, and Penetration Testing as a Service (PTaaS). Generative AI-assisted development increases code output speed but may also introduce insecure code and dependency component risks, driving the rapid development of AI-assisted vulnerability detection, automated attack verification, and intelligent remediation recommendations. As application architectures migrate to cloud-native, microservices, APIs, containers, and serverless environments, API security testing, software supply chain security, SCA, SBOM verification, and cloud configuration testing are becoming high-growth services.
