## Abstracts

The global Aquaculture Circulating Water Filtration Materials market size is predicted to grow from US$ 45.00 million in 2025 to US$ 88.68 million in 2032; it is expected to grow at a CAGR of 10.4% from 2026 to 2032.

Aquaculture recirculating aquaculture system (RAS) filtration media refers to various filter media used in RAS systems, primarily for solid-liquid separation, ammonia nitrogen conversion, and water quality stabilization. These materials typically include mechanical and biological filter media. Biological filter media, through their porous structure, provide a space for nitrifying bacteria to attach and grow, converting toxic ammonia nitrogen and nitrite into relatively safe nitrate, thereby maintaining the ecological balance of the aquaculture water. Aquaculture recirculating aquaculture system filtration media is a key consumable for achieving high-density aquaculture, water-saving operation, and stable production in RAS systems. Its performance directly affects water quality safety, aquaculture success rate, and system operating costs. In 2025, sales volume was 7,500 tons, with an average price of US$5,500 per ton, a gross profit margin of 47%, and a total production capacity of 8,500 tons.

United States market for Aquaculture Circulating Water Filtration Materials is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
