## Abstracts

The global Aquaculture Solid-liquid Separation Filter Material market size is predicted to grow from US\$ 45.00 million in 2025 to US\$ 88.68 million in 2032; it is expected to grow at a CAGR of 10.4% from 2026 to 2032.

Aquaculture solid-liquid separation filtration materials refer to functional filter media used in aquaculture recirculating water or drainage systems to efficiently separate suspended solids from the liquid phase in aquaculture water. They primarily intercept and remove particulate pollutants such as feces, uneaten feed, and flocculent organic matter. These materials are typically placed in the front-end mechanical filtration units of the recirculating water system (such as drum filters, sand filters, or sedimentation filtration modules). Through screening, interception, or inertial separation, they reduce water turbidity and organic load, creating the foundation for downstream biological filtration and stable water quality operation. With the development of factory farming and high-density aquaculture models, aquaculture solid-liquid separation filtration materials are upgrading towards higher throughput, lower resistance, corrosion resistance, and ease of cleaning, becoming key consumables for ensuring the stability of aquaculture systems and reducing disease risks. In 2025, sales volume was 7,500 tons, with an average price of US\$5,500 per ton, a gross profit margin of 47%, and a total production capacity of 8,500 tons.
