The global Aquaculture System Main Circulation Pump market size is predicted to grow from US\$ 610 million in 2025 to US\$ 1056 million in 2032; it is expected to grow at a CAGR of 8.3% from 2026 to 2032.

The main circulation pump in an aquaculture system is the core power unit of the recirculating aquaculture system (RAS). It continuously circulates the aquaculture water between the culture tanks, filtration units, biological treatment modules, and disinfection system, ensuring long-term stability of water quality parameters. By providing a stable flow rate and head, this equipment delivers the aquaculture water to mechanical filtration, biological filtration, deaeration, oxygenation, and return stages, achieving efficient control of ammonia nitrogen, nitrite, and suspended solids. It is a critical infrastructure for maintaining dissolved oxygen levels, water temperature uniformity, and metabolic waste discharge capacity within the aquaculture system. The operational reliability and energy efficiency of the main circulation pump directly determine the overall treatment load, operating costs, and upper limit of stocking density for the entire aquaculture system. In 2025, sales were estimated at approximately 690,000 units, with an average selling price of approximately US\$850 per unit, total production capacity of 750,000 units, and a gross profit margin of 34%.
