Aquaculture Water Quality Testing Services are integrated monitoring systems used to detect and analyze various water quality parameters in real time, such as dissolved oxygen, pH, ammonia nitrogen, nitrite, temperature, and salinity, ensuring a suitable environment for aquatic organism growth. This solution typically consists of sensors, data acquisition units, a cloud-based data analysis platform, and display terminals. It automatically collects water quality data and uploads it to the cloud platform via wireless communication technology, enabling remote monitoring and decision support for aquaculture enterprises. The system boasts advantages such as high precision, high automation, remote control, and intelligent early warning, and is widely used in aquaculture farms, fisheries enterprises, research institutions, and environmental protection departments. Upstream raw materials include high-precision sensors, electronic components, communication modules, and plastic casings; downstream supply mainly consists of aquaculture farms, fisheries companies, and water quality testing companies, sold through distributors or system integrators. Future development directions lie in improving system integration and intelligent data analysis. With the increasing demand for intelligent management and environmental monitoring in aquaculture, the market prospects are broad.
