The global Aquarium Protein Skimmer market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

An aquarium protein skimmer, also known as a foam fractionator or skimmer, is a device used in marine and reef aquariums to remove organic compounds, proteins, and other dissolved and particulate matter from the water. It is an essential component of marine aquarium filtration systems.

The protein skimmer works on the principle of foam fractionation. It introduces air bubbles into the aquarium water, creating a frothy mixture at the water's surface. Organic compounds and proteins in the water are attracted to the surface of the air bubbles, forming a foam. The foam, which contains these impurities, rises into a collection cup or chamber where it can be removed from the aquarium system.

The main purpose of using a protein skimmer is to improve water quality by removing substances that can contribute to nutrient buildup, algae growth, and other issues in marine aquariums. By efficiently removing these organic compounds, protein skimmers help maintain a healthy and stable aquatic environment for marine organisms.

United States market for Aquarium Protein Skimmer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
