An arbitrary waveform signal generator is a type of electronic device that can generate non-periodic, programmable waveform signals. An arbitrary waveform generator uses digital signal processing technology to convert digital signals into analog signal outputs. Its basic structure includes a control unit, a waveform memory, a digital/analog converter (DAC), and an amplifier output circuit. The arbitrary waveform generator stores digital signals in a waveform memory, performs mathematical operations and transformations on these digital signals under the control of the control unit, and then converts them into analog signals that can be output on an external interface through a DAC and an amplifier output circuit.
