Abstracts

The global Arc Perimeter market size is predicted to grow from US$ 189 million in 2025 to US$ 273 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

In 2024, global production of arc perimeters reached 13,017 units, with an average selling price of $14,085 per unit.

Arc perimetry is a specialized ophthalmic instrument used for dynamic peripheral visual field assessment. Its base plate is a 180° curved plate with a typical radius of 33 cm, capable of 360° rotation around its horizontal axis. During the examination, the subject's lower jaw is fixed in a mandibular frame, with one eye fixating on the white fixation dot in the center of the arc, while the other eye is covered. The examiner slowly moves an optotype (usually a 3mm or 5mm diameter white or red cursor) along the inner surface of the arc from the periphery toward the center. The position of the optotype is recorded when the subject notices it. Ultimately, the equal threshold points on each meridian are connected to plot the visual field and scotoma distribution. This device uses a mechanical synchronization mechanism to ensure that the optotype movement is linked to the stylus, and supports dynamic adjustment of the optotype's brightness, size, and color. It is a classic tool for screening and localizing peripheral visual field defects such as glaucoma and retinopathy.

The upstream of arc perimetry involves optical components, electronic components, and precision mechanical parts (optical lenses, sensors, microprocessors, etc.); the midstream involves planar perimetry manufacturing (ZEISS, Haag-Streit, etc.); and the downstream is ophthalmic diagnostics in medical institutions (hospitals, ophthalmology clinics, etc.). These devices are primarily used for early diagnosis and treatment monitoring of eye diseases such as glaucoma. The industry trend is toward improved precision and intelligence in these devices, as well as their deep integration with the

ophthalmic diagnosis and treatment system (e.g., standardized operations to improve diagnostic accuracy and meet the needs of disease prevention and treatment such as glaucoma).
