An arm sling with lumbar support is a medical device used to provide support and stability to help rehabilitation patients control the movement of their arms. This sling usually consists of three parts: a waist belt, a shoulder strap and an arm sling. The design with lumbar support can reduce the pressure on the waist and avoid discomfort to the waist after prolonged use. At the same time, the shoulder straps and arm slings can provide additional support and stability, help patients maintain correct posture and

movement patterns, and reduce the range of motion of the arms, thereby facilitating the recovery of rehabilitation patients. Arm sling with lumbar support is commonly used in the treatment of shoulder and arm fractures, dislocations, arthritis, rotator cuff tears, arm muscle injuries, and other diseases or trauma.
