The structural principle of the armored thermocouple is made of a conductor, high-insulation magnesium oxide, and a stainless steel protective tube with an outer sheath. Various mounting fixtures, the electrodes of which are conductors of two different components, welded at both ends to form a loop. The direct temperature measuring end is called the working end, and the temperature measuring end is called the cold end, also known as the reference end. When there is a temperature difference between the working end and the reference end, thermal current will be generated in the circuit.

Armored thermocouples can generally measure the surface or internal temperature of gases, liquids, vapors, and solids within the range of 0 to 1300 ° C, and can be used with digital instruments, recording and regulating instruments, PLCs, data collectors or computers.
