Array-based systems is a screening process used in drug development and discovery in the usually used pharmaceutical and biotechnology industry. These systems enable monitoring molecular interactions in an array format. The traditional labelled technologies have certain limitations and drawbacks making the drug discovery process less effective which has given to the rise of label-free array systems. Label-free array systems provide measurements that are highly sensitive for a target that is endogenous in live cell assays and eliminates the need for dyes, reagents, engineered cells, and tags.
