The global Arthroscopic Resection Device market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

An Arthroscopic Resection Device is a device used to perform arthroscopic surgery, which can be used to cut and remove tumors, lesions, or other abnormal soft tissues. The device typically consists of a rotatable motorized blade and a flexible fiber optic lens that can be inserted through a small hole inside a human joint to perform the procedure under a microscope.

There are many advantages to performing surgery with an Arthroscopic Resection Device. First of all, arthroscopic surgery only needs to make a small hole around the joint, which has little impact on the surrounding tissue, and the patient recovers quickly after surgery with less pain. Second, the high precision and control of this device allows for more accurate resection of the tissue that needs to be removed, while also helping to reduce the risks and complications of surgery.
