Artificial cartilage material is a type of metamaterial developed based on biomimetic principles. Its core design mimics the microstructure and function of human articular cartilage, creating a three-dimensional ultramicrostructure that combines high energy absorption, fatigue resistance, and environmental adaptability. This material typically consists of a mixture of nanoscale pores and soft matrix cells. Its microstructure includes micrometer-scale interconnected pores and nanoscale surface grooves and protrusions. This multi-level structure enables it to convert over 90% of the impact kinetic energy into heat through mechanisms such as hysteretic deformation and viscoelastic dissipation, achieving efficient energy absorption and dispersion.

United States market for Artificial Cartilage Material is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Artificial Cartilage Material is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

Europe market for Artificial Cartilage Material is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
