Abstracts

The global Artificial Intelligence for Blockchains market size is predicted to grow from US\$ 704 million in 2025 to US\$ 3512 million in 2032; it is expected to grow at a CAGR of 25.9% from 2026 to 2032.

Artificial Intelligence for Blockchains refers to applying machine learning, graph analytics, and generative/agentive AI to blockchain and crypto ecosystems to detect, predict, and automate decisions on on-chain transactions and address graphs, smart-contract code and runtime events, and market/fund-flow signals—improving security, compliance, and operational efficiency. It is delivered primarily as software and services, typically composed of on-chain data ingestion and indexing (nodes/RPC, indexers, entity clustering and labeling), feature engineering plus model training/inference, signal delivery via APIs/SDKs with dashboards and case management, and enforcement/governance components (alert orchestration, policy constraints, permissions and limits, traceable audit logs, optionally backed by trusted execution environments or zero-knowledge style verification). Key use cases include smart-contract auditing and runtime monitoring, AML/KYT and transaction risk scoring, fraud and attack detection, and market intelligence with controlled automation for trading and asset management. Major supply hubs commonly include the United States, the UK/Europe, Singapore, and China.

Artificial Intelligence for Blockchains is evolving from an auxiliary analytics tool into a core productivity layer for blockchain systems, driven by the convergence of rising on chain complexity, tightening regulatory requirements, and rapid advances in AI capabilities. As multi chain deployments, cross chain interactions, and high frequency smart contract calls become standard, manual and rule based approaches are no longer sufficient to identify risks in a timely manner, prompting institutions to embed

machine learning, graph analytics, and agent based automation into transaction monitoring, contract security, and operational optimization. At the same time, regulators across major jurisdictions are strengthening requirements around anti money laundering, traceability, and risk disclosure, accelerating investment in intelligent compliance solutions. The maturation of large models and orchestration technologies further reduces the cost of interpretation and response, enabling AI systems to move beyond detection toward actionable decision making.

Despite strong momentum, the market faces notable challenges and risks. On chain data is inherently noisy and adversarial, requiring models to remain robust amid constantly evolving attack vectors and business patterns, which raises the bar for data governance and lifecycle management. Institutional buyers have limited tolerance for false positives, missed detections, and opaque decision logic, pushing vendors to enhance explainability, auditability, and operational controls alongside algorithmic performance. In addition, automated execution can amplify losses during extreme volatility or network congestion, making the balance between efficiency and safety a central design consideration for Artificial Intelligence for Blockchains.

Downstream demand is increasingly shaped by platformization and full lifecycle coverage. Exchanges, custodians, and payment providers are shifting AI capabilities upstream into onboarding and end to end transaction controls, favoring standardized solutions that integrate quickly and support multi chain environments. Decentralized application and protocol teams prioritize runtime monitoring and automated incident response to shorten the window between detection and containment. Enterprise and consortium chain users are expanding adoption of auditable and explainable intelligence for risk control and data governance in tokenized assets, supply chain finance, and compliance reporting. Overall, competition is moving from point solutions to integrated platforms, and providers that combine data, algorithms, and governance mechanisms are best positioned to capture sustained global growth.
