There is no cure for Alzheimer's disease, but promising drugs have emerged in recent years that can help stop the disease's progression. However, these treatments must be carried out in the early stages of the disease in order to be effective. This race against time has inspired scientists to find ways to diagnose the condition earlier.

Apply machine learning algorithms to Alzheimer's disease to help diagnose early Alzheimer's disease more reliably. This is also an ideal application of artificial intelligence, because it is particularly good at discovering very subtle but decentralized processes.
