The global Artificial Intelligence Drug Discovery Platform market size is predicted to grow from US\$ 2054 million in 2025 to US\$ 5145 million in 2032; it is expected to grow at a CAGR of 13.5% from 2026 to 2032.

An Artificial Intelligence Drug Discovery Platform is an integrated software?data?(often automation stack that applies machine learning/generative AI and computational chemistry/biology to industrialize early drug R&D. In practice, it unifies (1) data ingestion and curation (multi-omics, chemical libraries, assay/phenotypic data, literature/knowledge graphs), (2) computational engines to identify/prioritize targets, generate or screen molecules, and predict key properties (potency, selectivity, ADMET, developability), and (3) workflow tools that connect in-silico design with wet-lab ?build-test-learn? cycles so experimental results continuously improve models and decision making. Some platforms are end-to-end and span biology ? chemistry ? preclinical decision support (typified by ?platform biotech? approaches), while others focus on a core layer such as physics-based molecular modeling or foundation-model development/deployment for biology that partners integrate into their pipelines. The industrial chain of Artificial Intelligence Drug Discovery Platforms includes upstream elements such as computing infrastructure, cloud services, GPUs, algorithm toolkits, biomedical databases, chemical libraries, assay results, and data labeling/curation resources. The midstream focuses on platform development and integration, including data engineering, model training, generative design modules, workflow orchestration, security, and compliance features. Downstream users include pharmaceutical companies, biotechnology firms, research institutes, and service organizations that apply the platforms to discover and optimize drug candidates. Supporting services cover implementation, customization, model monitoring, validation, training, and ongoing technical support.
