Asbestos is a naturally occurring mineral composed of heat, electrical, and corrosion-resistant flexible fibres. These qualities make asbestos useful, but they also make it exceedingly harmful to be exposed to it. Asbestos was widely used in structures as a good insulator, and it may be added to strengthen cloth, paper, cement, plastic, and other materials. Asbestos fibres, on the other hand, can get permanently entrenched in the body if inhaled or eaten. Asbestosis is a progressive lung illness caused by asbestos. Inflammation, scarring, and genetic damage are all possible side effects of asbestos fibres stuck in the body. Also, asbestos exposure can cause cancer and other severe health conditions.
