The global Aspergillus Niger Lipase market size is predicted to grow from US\$ 26.41 million in 2025 to US\$ 41.71 million in 2032; it is expected to grow at a CAGR of 7.3% from 2026 to 2032.

Aspergillus niger lipase is obtained through fermentation of Aspergillus niger or produced via recombinant expression of its gene, yielding a triglyceride-specific lipase preparation. It primarily catalyzes the hydrolysis of ester bonds in triglycerides to generate glycerol, mono- and diglycerides, and free fatty acids. It can also catalyze esterification and transesterification in low-water or non-aqueous systems. The estimated overall gross margin is approximately 58%.

This lipase belongs to the fungal-derived segment of microbial lipases. Demand is mainly driven by applications in food processing (cheese flavor enhancement and fat modification), nutritional supplements and feed digestibility, green organic synthesis, waste oil/fatwater treatment, as well as transesterification in biodiesel and lipid chemistry. Growth drivers include the adoption of non-animal-sourced enzymes, low-chemical-load processing, valorization of oil byproducts, and immobilization technologies that improve enzyme reuse. Constraints arise because Aspergillus niger lipase must compete with commercially available lipases from Thermomyces, Candida, Rhizopus, and other sources in detergent and large-scale fat/oil industries, and many end-users purchase lipases based on functional performance rather than the producing organism.
