Aspheric achromatic lens is an optical element, which adopts the design principle of aspheric lens and combines the characteristics of dispersion to achieve better imaging quality. Dispersion is the difference in the refractive index of light of different wavelengths in the lens, which will lead to chromatic aberration, that is, light of different wavelengths will converge at different positions, affecting the image quality. The aspheric achromatic lens can compensate for dispersion by designing the shape of the

aspheric surface so that the refraction angles of different wavelengths of light in the lens are different. Compared with traditional spherical lenses, aspheric achromatic lenses can effectively reduce spherical aberration and chromatic aberration, and improve imaging quality and resolution. Aspheric achromatic lenses are widely used in the fields of optical instruments, imaging systems and laser processing.
