Astronomy software is a collection of computer programs designed for astronomical research, data analysis, and science education. Its core functions include controlling astronomical telescopes, collecting and processing observational data, simulating celestial phenomena, visualizing the cosmic environment, and managing massive amounts of astronomical data. This highly specialized software processes data from all wavelengths of the electromagnetic spectrum (such as optical, radio, and infrared), particle detection data, and theoretical simulations. Key technologies include astrometry, photometry, spectral analysis, celestial mechanics calculations, cosmological simulations, and time-domain astronomy.

Modern astronomy software is evolving towards open source, standardization (adhering to IVOA specifications), cloud computing integration, and artificial intelligence processing, becoming a critical infrastructure driving innovation throughout the entire astronomical process, from data collection to scientific discovery.

United States market for Astronomy Software is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
