Astronomy Telescope Control Software is a dedicated program for remote or local operation of astronomical telescope systems. Its core function is to achieve precise control of telescope hardware and automate the observation process. Serving as the communication hub between the observer and the telescope, the software integrates control of key components such as the telescope mount (equatorial/aerial), camera, filter wheel, focuser, dome/mask, and guiding equipment through standardized driver protocols such as ASCOM and INDI. Key functions include telescope pointing and tracking control, coordinate system conversion and calibration, target import and observation sequence scheduling, autofocus, guiding correction, and safety monitoring. It is not only a convenient tool for amateur deep-sky photography or visual observation, but also a critical infrastructure for professional observatories to achieve remote, efficient, and unattended observations.

United States market for Astronomy Telescope Control Software is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
